| <b>Cat#</b>          | DIA-665                                                                                                                                                                                                                                                                                                  |
| <b>Descriptions</b>  | Bovin Beta-1, 4-Galactosyltransferase 1 (Bovin B4GALT1) is a native mammalian glycosyltransferase with high catalytic efficiency and strict linkage specificity, catalyzes $\beta$ -1,4 galactosylation of GlcNAc acceptors, and is a classical tool for in vitro glycoprotein glycosylation remodeling. |
| <b>Applications</b>  | Bovin Beta-1, 4-Galactosyltransferase 1 (Bovin B4GALT1) is widely used in in vitro glycoprotein glycosylation remodeling detection kits and glycan structure assay reagent development.                                                                                                                  |
| <b>CAS No.</b>       | 24-1-1070                                                                                                                                                                                                                                                                                                |
| <b>Enzyme Source</b> | Trichoplusia ni, High Five (baculovirus)-derived Bovin beta-1,4-Galactosyltran.                                                                                                                                                                                                                          |
