

Native *Proteus* sp. Glutamate Dehydrogenase (NADP-dependent)

Product Information

Cat#	DIA-196
Abbr	GLDH (NADP) (<i>Proteus</i> sp.)
Alias	GLDH
Similar	GLDH
Source	<i>Proteus</i> sp.
Description	Glutamate dehydrogenase (GLDH) is an enzyme, present in most microbes and the mitochondria of eukaryotes, as are some of the other enzymes required for urea synthesis, that converts glutamate to α -ketoglutarate, and vice versa. In animals, the produced ammonia is usually used as a substrate in the urea cycle. Typically, the α -ketoglutarate to glutamate reaction does not occur in mammals, as glutamate dehydrogenase equilibrium favours the production of ammonia and α -ketoglutarate.
Applications	This enzyme is useful for enzymatic determination of NH_3 , α -ketoglutaric acid and L-glutamic acid, and for assay of leucine aminopeptidase and urease. This enzyme is also used for enzymatic determination of urea when coupled with urease in clinical analysis.
